

Connect HDMI to Graphics Card Instead of Motherboard Port

Recently, I moved my desktop computer from my house to my parents' house. When setting it up, I connected the HDMI cable to the motherboard's HDMI port, but the monitor didn't display anything. I tried several times, but it still didn't work.

Then, I suddenly realized: Oh, there are HDMI ports on the graphics card! I disconnected the HDMI cable from the motherboard and plugged it into the graphics card's HDMI port. Immediately, the monitor worked perfectly.

Since I hadn't used this computer for almost half a year, I decided to update the system. I ran the following commands to install the latest upgrades:

```
sudo snap refresh
```

```
sudo apt upgrade
```

This ensured all the libraries and software were up to date.
